

ABSTRACT

A foldable smoking pipe is constructed from a flat blank of metal, small enough to fit in a wallet, that can be folded into a functional
5 smoking pipe with an integrated bowl, screen, and stem. The stem is formed by multiple flat panels folded to create a passageway having an opening at one end. The stem has an upper panel with holes in it to form the screen. The bowl is formed by multiple flat panels folded to surround the screen. The flat blank of metal has a number of fold lines,
10 which preferably are etched to about one-half the thickness of the metal blank, joining adjacent panels.
